

## CLAIM AMENDMENTS

### IN THE CLAIMS

This listing of the claims will replace all prior versions, and listing, of claims in the application or previous response to office action:

1-63. Cancelled

64. (New) A method of suppressing the interference of a masking agent selected from the group consisting of a leukocyte esterase, a myoglobin analogue, a hemoglobin analogue, a myoglobin derivative, a hemoglobin derivative, a myoglobin oxidation product, a hemoglobin oxidation product, a myoglobin breakdown product, a hemoglobin breakdown product, a ferritin, methemoglobin, sulfhemoglobin, and bilirubin, on a molecular assay of a nucleic acid-containing test sample, the method comprising:

contacting the test sample with a reagent consisting of from about 0.01 M to about 0.1 M of a chelator and from about 0.1 M to 1.0 M of a chelator enhancing component selected from the group consisting of lithium chloride, sodium salicylate, and combinations thereof,

wherein the interference of the masking agent on the molecular assay of the nucleic acid-containing test sample is suppressed.

65. (New) A method according to claim 64, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid, imidazole, ethylenebis(oxyethylenetriol)tetraacetic acid; iminodiacetate; and 1,2-bis(2 aminophenoxy)ethane-N,N,N',N' -tetraacetic acid; bis(5-amidino-2-benzimidazolyl)methane and salts thereof.

66. (New) A method according to claim 64 further comprising contacting the test sample with a buffer.

67. (New) A method of suppressing the interference of a masking agent selected from the group consisting of a leukocyte esterase, a myoglobin analogue, a hemoglobin analogue, a myoglobin derivative, a hemoglobin derivative, a myoglobin oxidation product, a hemoglobin oxidation product, a myoglobin breakdown product, a hemoglobin breakdown product, a ferritin, methemoglobin, sulfhemoglobin, and bilirubin, on a molecular assay of a nucleic acid-containing test sample, the method comprising:

contacting the test sample with a reagent having from about 0.01 M to about 0.1 M of a chelator and from about 0.1 M to 1.0 M of a chelator enhancing component selected from the group consisting of lithium chloride, sodium salicylate, sodium perchlorate, sodium thiocyanate, and combinations thereof,

wherein the interference of the masking agent on the molecular assay of the nucleic acid-containing test sample is suppressed.

68. (New) A method according to claim 67, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid, imidazole, ethylene*bis*(oxyethylenetriol)tetraacetic acid; iminodiacetate; and 1,2-*bis*(2-aminophenoxy)ethane-N,N,N',N'-tetraacetic acid; *bis*(5-amidino-2-benzimidazolyl)methane and salts thereof.

69. (New) A method according to claim 67, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid and 1,2-*bis*(2-aminophenoxy)ethane-N,N,N',N'-tetraacetic acid, and salts thereof.

70. (New) A method according to claim 67, wherein the masking agent is selected from the group consisting of leukocyte esterases and heme proteins.

71. (New) A method according to claim 67, wherein the heme protein is selected from the group consisting of myoglobin and hemoglobin analogs, and oxidation and breakdown products thereof.

72. (New) A method according to claim 67, wherein the masking agent is selected from the group consisting of ferritins, methemoglobin, sulfhemoglobin and bilirubin.

73. (New) A method according to claim 67, wherein the masking agent is selected from the group consisting of methemoglobin and bilirubin.

74. (New) A method according to claim 67 further comprising contacting the nucleic acid-containing test sample with an amount of at least one enzyme inactivating component selected from the group consisting of manganese chloride, sarkosyl, and sodium dodecyl sulfate in the range of up to about 5% molar concentration.

75. (New) A method according to claim 67, wherein the nucleic acid is selected from the group consisting of DNA, RNA, mRNA, and cDNA.

76. (New) A method according to claim 67, wherein the nucleic acid is eukaryotic DNA.

77. (New) A method according to claim 67, wherein the molecular assay is selected from the group consisting of a polymerase chain reaction, a ligase chain reaction, nucleic acid sequence-based amplification, strand displacement amplification, and a genetic transformation test.

78. (New) A method according to claim 67, wherein the molecular assay comprises a polymerase chain reaction.

79. (New) A method of improving the signal response of a molecular assay of a nucleic acid-containing test sample, the method comprising:

contacting the nucleic acid-containing test sample with a reagent consisting of from about 0.01 M to about 0.1 M of a chelator and from about 0.1 M to 1.0 M of a chelator enhancing component selected from the group consisting of lithium chloride, sodium salicylate, and combinations thereof to form a preserved test sample, wherein the interference of a masking agent selected from the group consisting of a leukocyte esterase, a myoglobin analogue, a hemoglobin analogue, a myoglobin derivative, a hemoglobin derivative, a myoglobin oxidation product, a hemoglobin oxidation product, a myoglobin breakdown product, a hemoglobin breakdown product, a ferritin, methemoglobin, sulfhemoglobin, and bilirubin on the molecular assay is suppressed;

extracting molecular analytes of interest from the preserved test sample; and

conducting a molecular assay on the extracted molecular analytes of interest, wherein the signal response of the molecular assay is improved relative to a molecular assay performed without the reagent.

80. (New) A method according to claim 79, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid, imidazole, ethylene*bis*(oxyethylenetriol)tetraacetic acid; iminodiacetate; and 1,2-*bis*(2-aminophenoxy)ethane-N,N,N',N'-tetraacetic acid; *bis*(5-amidino-2-benzimidazolyl)methane and salts thereof.

81. (New) A method according to claim 79 further comprising contacting the test sample with a buffer.

82. (New) A method of improving the signal response of a molecular assay of a nucleic acid-containing test sample, the method comprising:

contacting the nucleic acid-containing test sample with a reagent having from about 0.01 M to about 0.1 M of a chelator and from about 0.1 M to 1.0 M of a chelator enhancing component selected from the group consisting of lithium chloride, sodium salicylate, sodium perchlorate, sodium thiocyanate, and combinations thereof to form a preserved test sample, wherein the interference of a masking agent selected from the group consisting of a leukocyte esterase, a myoglobin analogue, a hemoglobin analogue, a myoglobin derivative, a hemoglobin derivative, a myoglobin oxidation product, a hemoglobin oxidation product, a myoglobin breakdown product, a hemoglobin breakdown product, a ferritin, methemoglobin, sulfhemoglobin, and bilirubin on the molecular assay is suppressed;

extracting molecular analytes of interest from the preserved test sample; and

conducting a molecular assay on the extracted molecular analytes of interest, wherein the signal response of the molecular assay is improved relative to a molecular assay performed without the reagent.

83. (New) A method according to claim 82, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid, imidazole, ethylene*bis*(oxyethylenetriol)tetraacetic acid; iminodiacetate; and 1,2-*bis*(2-aminophenoxy)ethane-N,N,N',N'-tetraacetic acid; *bis*(5-amidino-2-benzimidazolyl)methane and salts thereof.

84. (New) A method according to claim 82, wherein the divalent metal chelator is selected from the group consisting of ethylenediaminetetraacetic acid and 1,2-*bis*(2-aminophenoxy)ethane-N,N,N',N'-tetraacetic acid, and salts thereof.

85. (New) A method according to claim 82, wherein the masking agent is selected from the group consisting of leukocyte esterases and heme proteins.

86. (New) A method according to claim 85, wherein the heme protein is selected from the group consisting of myoglobin and hemoglobin analogs, and oxidation and breakdown products thereof.

87. (New) A method according to claim 82, wherein the masking agent is selected from the group consisting of ferritins, methemoglobin, sulfhemoglobin and bilirubin.

88. (New) A method according to claim 82, wherein the masking agent is selected from the group consisting of methemoglobin and bilirubin.

89. (New) A method according to claim 82 wherein the nucleic acid-containing test sample is further contacted with an amount of at least one enzyme inactivating component selected from the group consisting of manganese chloride, sarkosyl, and sodium dodecyl sulfate in the range of up to about 5% molar concentration.

90. (New) A method according to claim 82 wherein the nucleic acid-containing test sample is a bodily fluid.

91. (New) A method according to claim 90, wherein the bodily fluid is selected from the group consisting of urine, blood, blood serum, amniotic fluid; cerebrospinal and spinal fluid; synovial fluid; conjunctival fluid; salivary fluid; vaginal fluid; stool; seminal fluid; lymph; bile; tears, and sweat.

92. (New) A method according to claim 91, wherein the bodily fluid is urine.

93. (New) A method according to claim 82, wherein the nucleic acid is selected from the group consisting of DNA, RNA, mRNA, and cDNA.

94. (New) A method according to claim 82, wherein the nucleic acid is eukaryotic DNA.

95. (New) A method according to claim 82, wherein the molecular assay is selected from the group consisting of a polymerase chain reaction, a ligase chain reaction, nucleic acid sequence-based amplification, strand displacement amplification, and a genetic transformation test.

96. (New) A method according to claim 82, wherein the molecular assay comprises a polymerase chain reaction.
